Spreadsheets are used to store information and data. Once we have our information in a spreadsheet we can run powerful calculations, make graphs and charts and analyse patterns.

Other uses for spreadsheets –

- Modelling and Planning
- Home/Business Finance and Budgeting
- Wages/Invoices
- Predictions / Simulations / Calculations
- Creating charts and graphs

Y9 Knowledge Organiser - Spreadsheets

What is a Function?	A function is a standard routine used to perform common tasks. It represents a complex formula that uses reserved words e.g. VLOOKUP, IF. A function performs a specific set of operations on its input values to produce a single output value.
What is a Formula?	Using formulas in spreadsheets can allow you to quickly make calculations and get totals of multiple cells, rows, or col- umns in a spreadsheet .
Conditional Formatting	is a tool that allows you to apply formats to a cell or range of cells, and have that formatting change depending on the value of the cell or the value of a formula. For example, you can have a cell appear bold only when the value of the cell is greater than 100.

Common Formulas/Functions	= SUM	Adds a range of cells together
	= AVERAGE	Finds an average for a range of cells
	= MIN	Returns the smallest value in range
	= MAX	Returns the highest value in a range
	= COUNT	Counts cells if they meet a condition

IF	one of the logical functions , to return one value if a condition is true and another value if it's false. For example: = IF (A2>B2,"Over Budget","OK") = IF (A2=B2,B4-A4,"")	
Count IF	=COUNTIF (Where do you want to look?, What do you want to look for?)	
Auto SUM	SUM Excel automatically enters a formula (that uses the SUM function) to sum the numbers	
= COUNT	Counts cells if they meet a condition
